Neptune North

Neptune North Challenge

Actors work better together

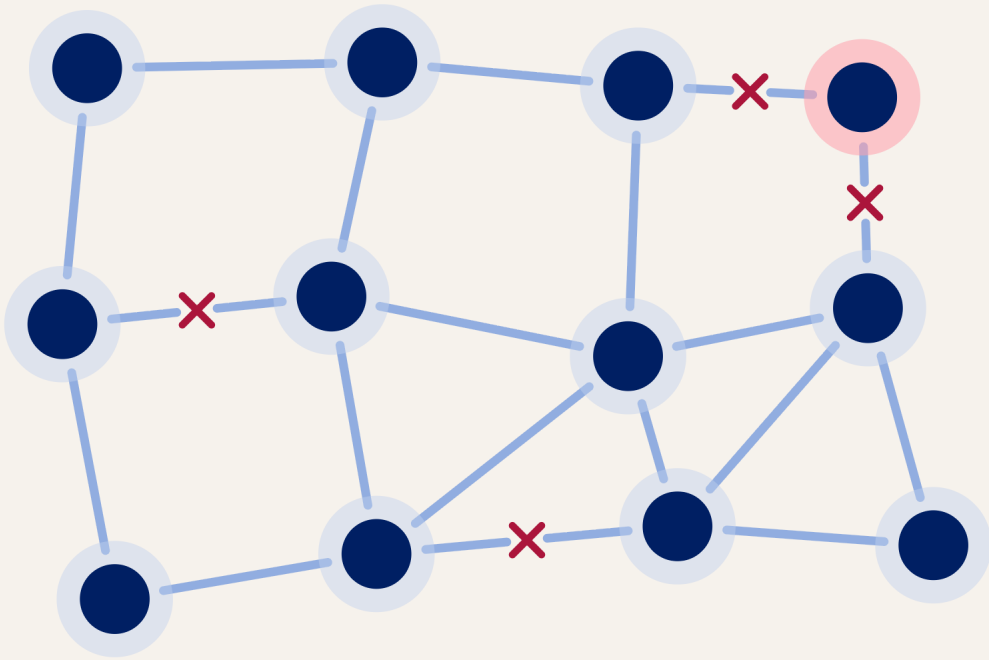

Neptune North · November 2026

Challenge background

Modern technology often relies on multiple systems collaborating on a common goal. For example, drones in a light show; robots in fulfilment centres; or LLMs solving different parts of a large problem.

In some situations, communication between these systems is unreliable or unavailable. When this happens, each actor needs to be able to operate without receiving instructions from a central hub.

We want you to design an approach to a problem which involves systems working together in a distributed fashion, even when communications are interrupted.

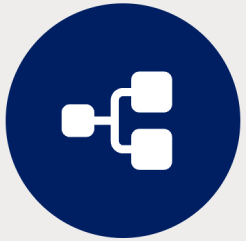

Judging criteria

Working towards a common goal

Multiple actors should work together to solve a problem

Independent decision-making

Each actor makes decisions independently to support the group

Resilience when communications fail

Actors can still make some progress, even when they can't communicate

Something you're excited about

Solve a problem that's interesting to you, in a way that's interesting to you
